

Introduction

- In this topic, we will
 - Describe the assumptions that will be made in the next three sub-topics
 - Explain how we are assuming negligible error
 - Look at what information we are trying to extract from these readings

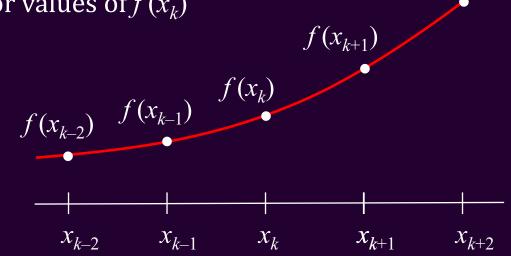

Representing a polynomial

- Recall that we have pointed out that sensors are generally sampled periodically
 - The next three topics will attempt to:
 - Evaluate an interpolating polynomial at a point close to x_k
 - Estimate the derivative at the point x_k
 - Estimate an integral from some point x_{k-n} up to x_k
 - We will assume negligible error in the readings or values of $f(x_{\iota})$

$$f(x_{k+2})$$

Representing a polynomial

• In each case, we will assume that the x_k values are equally spaced, so in general

$$x_k = x_0 + kh$$

– Also, it follows, therefore, that:

$$x_{k-1} = x_k - h$$

$$x_{k+1} = x_k + h$$

$$f(x_{k+2})$$

$$f(x_{k+2})$$

$$f(x_{k-2})$$

$$x_{k-2}$$

$$x_{k-1}$$

$$x_k$$

$$x_k$$

$$x_{k+1}$$

$$x_{k+2}$$

Looking ahead

- Once we have examined these approaches, we will proceed to look at techniques that can be used when there are significant errors in the readings
 - These errors may be due to difficulty in making readings or limitations on the sensors in question
 - For example, GPS is only so accurate to approximately 4 m

Summary

- Following this topic, you now
 - Understand that in the next three sub-topics,
 we will use interpolating polynomials
 - Understand that the errors in the sampled values are assumed to be negligible
 - Know that in the following topic, we will look at solutions that don't necessarily assume negligible error
